

FAST

Freeway, Arterial, Street, and Tactical transit study for the Research Triangle metropolitan area

Project Impetus and Overview

- RTA is spearheading a follow-up study to the 2020-21 FAST study ([overview¹](#), [documents²](#)), with an overall objective of prioritizing transit.
- This follow-up effort, “FAST 2.0” transit study – Freeway, Arterial, Street, and Tactical transit – is being managed by NCDOT; the consultant is WSP.
- The study will focus on ways to advance the implementation of transit priority infrastructure; i.e., to make our freeways and streets “transit ready”. This includes accelerating BRT linkages to RTP and RDU from downtown Raleigh, Durham, Chapel Hill, and Cary. It also includes the advancement of “SMART” freeways (Systematic Management of Adaptable Roadways through Technology) to create better operations for transit and all vehicles at lower costs and impacts.
- The study formally begins in February 2024 will take around 12 months to complete.

Geography

The FAST transit study will incorporate a review of potential dynamic transit priority shoulders, key linkages with proposed BRT corridors and extensions, and other transit priority measures for several of the freeways and primary arterials in the core metropolitan Triangle area, including Wake, Durham, Orange, Johnston, and Chatham counties.

There may also be an examination of potential connections in counties in the extended metropolitan area and environs, including Franklin, Nash, Wilson, Granville, Lee, Harnett, Alamance, Person, Wayne, and Moore.

Deliverables

The FAST study will create specific project recommendations, including express designs, that will advance transit priority infrastructure solutions. These could include:

Express designs or feasibility studies of potential freeway platform exchange stations along I-40 near RDU Airport and Research Triangle Park

Direct freeway/BRT ramp linkages at key locations

An implementation framework for activating dynamic transit priority shoulders and accelerating SMART infrastructure along specific freeway segments

The FAST study may also identify vital policy and funding changes that will advance transit in the Triangle market and across North Carolina.

Outreach and Funding Partners

- There will be ongoing outreach with stakeholders on concepts, ideas, and express designs of proposed transit priority elements. This outreach will take the form of curated focus groups, presentations, and other engagement mechanisms.
- NCDOT will activate a streamlined project webpage to provide effective study outreach.
- RTA will highlight the progress of the work at the “RTA Transportation Brunch 2024: Accelerating Multimodal Freeways in the Metropolitan Triangle” event on August 6.
- There are 14 funding partners: cities of Raleigh and Durham; towns of Cary and Chapel Hill; counties of Wake, Durham, Orange; DCHC MPO, CAMPO; GoTriangle; Research Triangle Foundation; Central Pines Regional Council, NCDOT, and RTA.
